Course:

Physical Education & Fitness

Name:

Aisyah Currents (25091397108)

Class:

2025I

INFORMATICS MANAGEMENT STUDY PROGRAM

FACULTY OF VOCATION

UNIVERSITAS NEGERI SURABAYA

2026

A. Activity Description

The activity performed was walking at a moderate pace.

1. **Total Duration:** Approximately 41 Minutes
2. **Activity Details:** Walking continuously for 41 minutes at a steady and comfortable pace from my boarding house to Royal Plaza mall, then walking around the mall.

B. Heart Rate Data

Heart rate calculation is used to measure cardiovascular response to physical activity.

1. **Maximum Heart Rate(MHR):**

Using the standard formula:

$$\begin{aligned}\text{MHR} &= 220 - \text{Age} \\ \text{MHR} &= 220 - 19 = 201 \text{ bpm}\end{aligned}$$

2. **Average Heart Rate During Activity**

Based on measurement, the average heart rate during the activity was **85 bpm**.

C. Intensity Classification

Based on the activity performed, this exercise is classified as **Low Intensity**.

Reasoning:

1. **Type of Activity:** Walking at a relaxed pace does not place heavy stress on the cardiovascular system.
2. **Heart Rate Percentage:** The average heart rate (85 bpm) is around **42% of Maximum Heart Rate**, which falls under light activity.
3. **Physical Response:** Breathing remains normal, and conversation can be carried out easily during the activity.

D. Activity Documentation

Attached are screenshots of the heart rate measurement results using the Instant Heart Rate application, as well as activity tracking results from Strava.

Note: The heart rate (bpm) was measured after completing the walking session, not during the activity, due to the absence of a more efficient heart rate monitoring device such as a smartwatch or smartband.

Additionally, the Strava screenshots provide supporting data regarding the duration and distance of the walking activity.
